Value Of Higher Education

The success of a person is measured through the amount of knowledge the individual has received through four years of undergrad or graduate school, while being disciplined to see that the more degrees or higher education the individual has obtained is value. The value of a university is the start of a higher education for a better lifestyle. Experiencing different classes in college through medicine, engineering, law, nursing and much more gives young people an idea of what career they see themselves in. Personal development benefits the individual by connecting their higher education to important and realistic enhancements to their life such as, better communication, greater sense of discipline, realization of passions and much more. Instead of dropping out, an individual having a higher education can experience practical benefits proven through economic trends, healthier choices, and civic involvement. Education is a powerful tool making it worthwhile as a life experience to receive career preparation, broader practical benefits, and personal development.

Career preparation gives a student who received higher education to map out their future clearly. Having a clear mind from experiencing your pre career pathway in college such as pre business, premedical, prelaw and more, gives a person an idea of how their career preparation will continue into a higher level. “Many students also pursue double majors in a helping profession and a liberal arts discipline such as American studies, environmental studies, mathematics, or the visual arts” (Katz 10) to add something extra for a competitive and successful application as a future employee. Also, “business leaders report that they want to hire college graduates who possess both a broad education and specific workforce skills” (Katz 5) that appreciates gaining workforce experience while taking their coursework seriously for a distinct background of knowledge and service. “Conducted by the National Association of Colleges and Employers found that 80 percent of all bachelor’s degree graduates had achieved a positive career outcome—defined as full-time employment, self-employment, military or other public service, or continuing education—within six months of receiving a diploma” (Katz 5) that also results in a successful pay rate from obtaining the value of higher education.

Personal development comes from improved communication, critical thinking, personal skills, realization of passions and a sense of accomplishments and discipline. Improved communication is proven by being enrolled in classes with requirements to give a presentation, speaking assignments to a classmate, or a group interaction “strategy of psychological and educational assistance in pedagogical interaction with them” (Orlov, Pazukhina, Yakushin, Ponomareva 76). Critical thinking skills from higher education is crucial in life and “students will grow substantially in their ability to correctly apply critical thinking and problem-solving techniques to problem situations” (Roberts 2). Identifying the personal skills that you’ve developed after receiving higher education and then creating new skills, gives the person a higher chance to excel in complex areas. Having a broader foundation of skills, can better your expectations in knowledge to receive higher education. Realization of passions from personal development, puts a young person in a desirable high education setting with a better perspective that are increasing their list of passions for personal growth. Greater sense of discipline will intertwine as having the natural discipline to be responsible in a higher education environment and then putting your academic achievements as a top priority to gain higher education. Having the sense of accomplishment will help a young person be motivated towards

their goals as a student for higher education as they choose to enter a higher education setting. Personal development is an overall achievement from receiving higher education as the person undergoes valuable development stages.

Broader practical benefits are economic, health, and civic involvement while obtaining higher education. “In seeking to ensure that higher education policy is designed to maximize benefits to individuals and to society as a whole” (Courage 29), people who are applicable will be prioritized and prepared substantially in life. For a person “to go to university would bring economic and social benefits” (Courage 35) would receive higher education and “potential income whilst at university could be seen as an investment in higher potential salaries after graduating” (Courage 42). An example of health benefits for choosing higher education are the “benefits from the G.I. Bill on veteran’s general health status and smoking behavior. Veterans who used the education benefits will be in better health” (Rumery 2). Students with higher education are more likely to be educated in politics and community affairs that has to do with civic involvement. Devoting your higher education for more knowledge then your degree or increasing your education, will give the person many benefits.
